

The JCCleaner is an automatic solar panel cleaner, that can be used at all heights and for all sizes of solar panels. The JCCleaner is built as a drone allowing it to fly to any solar panel position. It will then land on the solar panel and with it's synthetic setae gecko belt move up and down on the solarpanels surface. The synthetic setae works like a dry adhesive. The JCCleaner will fly back to it's docking station after cleaning to refuel on water and power. This is all done automatically, so the owner never has to think of cleaning the solar panels again.

Dirt on solar panels is a bigger Problem than people think. It results in approximately 20% fewer Energy, which could be used for watching TV 60 hours the month per panel!
So do you want to lose these 20%? Are you afraid of cleaning the solar panel yourself?

- Dissipation of approx. 20%
- Routinely cleaning of the panel
- Dangerous work in heights
- Challenging to clean

No problem, since there is still the **JCCleaner!**
